ABRIDGED INDEX MEDICUS ERRATA 1974 - 75

The installation of new computer programs and equipment, whether as an initial automation effort or as the replacement of an existing system, is usually fraught with difficulty. The NLM's conversion to its new MEDLARS II system has been no exception. As a result, many users of Abridged Index Medicus have noticed a large number of incorrect citations during the last year. The cause of the majority of these errors, resulting in incorrect assignment by the computer of journal references, has been diagnosed and corrected. The following list provides the correct journal source for all those which we know to have been cited in error during the last year.

Abridged Index Medicus, like all works of its magnitude, will continue to have an occasional error despite our efforts to prevent this. All users of Abridged Index Medicus and other products of MEDLARS are encouraged to bring errors to our attention so they may be corrected for publication in Cumulated Abridged Index Medicus. The editors wish to take this opportunity to extend our appreciation to all those who have sent error notices, and to express our regrets for any inconvenience such errors may have caused.

The underscoring in the left-hand column indicates, by issue, the error in the Abridged Index Medicus reference citation whether the error occurs as an incorrect journal title, volume or date. The underlining in the center column highlights the corresponding correction. (It should be noted that, in some cases, the correct journal as cited in this column is not one of those included in Abridged Index Medicus.) The figures in the right-hand column show the number of articles affected by the error.

INTRODUCTION TO ABRIDGED INDEX MEDICUS

The *Abridged Index Medicus* is designed to afford rapid access to selected biomedical journal literature of immediate interest to the practicing physician.

Each issue contains citations from 100 English-language journals, representing a subset of one month's input into the National Library of Medicine's computer-based MEDLARS (Medical Literature Analysis and Retrieval System). The selection of the journals was made by the Library with guidance from a group of consultants consisting of physicians, medical editors, and medical librarians. Consideration was given to the quality of the journals, usefulness of journal content for the medical practictioner, and the need for providing coverage of all fields of clinical medicine. In some fields, where there are more high-quality journals than could be included in the bibliography, consideration was given to the availability of the journals to the American practitioner. In limiting the size of *Abridged Index Medicus* it was necessary to omit many excellent publications. The list of journals indexed will be reviewed periodically and is subject to change. On those occasions when a physician's interests require a scanning of the literature that is not contained in the *Abridged Index Medicus,* he will, as before, turn to the full *Index Medicus* and to the numerous other bibliographic sources.

Journal issues do not arrive at the National Library of Medicine with perfect regularity, nor is it possible to maintain a precise schedule for indexing. Therefore, a given month's *Abridged Index Medicus* may contain citations to articles from more than one issue of a monthly journal, or a journal may not be covered in a given issue of *AIM*.

USING ABRIDGED INDEX MEDICUS

Subject Headings

Input to MEDLARS begins with the indexing of journal articles. The content of each article is analyzed and described by a group of terms (subject headings) selected from *Medical Subject Headings (MeSH),* the National Library of Medicine's authority list of technical terms. The bibliographic citations in *Abridged Index Medicus* appear under those subject headings. An acquaintance with *MeSH* (see publications list) will help the user of *AIM* determine which specific headings to consult.

When articles are indexed, the most specific term available in *MeSH* is used. Thus, if an article is concerned with erythromycin, it would be indexed under that term, rather than the broader "antibiotics." Under the latter term, one would find only: (a) articles dealing with antibiotics generally, (b) those that deal in a very general way with a large number of named antibiotics, or (c) those that deal with specific antibiotics which have not been separately listed in *MeSH*.

The physician who is interested in one concept may find that the broader term is also worth examining for articles of possible interest. Although one may be interested primarily in antifungal antibiotics, articles on the general subject of antifungal agents may be useful.

The physician who wants articles on some aspect of the use of antibiotics in pediatric practice would certainly want not only general articles that would appear under "antibiotics," but also those concerned with specific antibiotics.

Monthly issues of *Abridged Index Medicus* are arranged in two sections: Subject Section and Author Section.

Subject Section

Each article cited in *AIM* will be found under several subject headings, which represent the central concepts of the article. The citation appears in full under each subject heading. Each citation contains the following elements, in order: title of article; first author (if more than one) or sole author; journal title abbreviation; volume number; inclusive pagination; and date of issue.

Example:

Tendon transfers to improve grasp after injuries of the cervical spinal cord. Freehafer AA, et al.
J Bone Joint Surg [Am] 56:951-9, July 74

The above citation appears under four subject headings:

FINGERS
PARALYSIS
SPINAL CORD INJURIES
TENDON TRANSFER

In the citations, under each of the subject headings, only the first author's name appears. (For names of the second and third authors, refer to the Author Section.)

Journal titles are abbreviated; the full title may be found by reference to the abbreviation listing on the next page.

Author Section

References in the Author Section cite a maximum of three authors' names; the title of the article; the journal title abbreviation; volume number; inclusive pagination; date of issue.
Example:

Freehafer AA, Vonhaam E, Allen V: Tendon transfers to improve grasp after injuries of the cervical spinal cord.
J Bone Joint Surg [Am] 56:951-9, July 74

Complete citations are printed only under the first author's name; the second and third authors' names are cross-referenced to the first author's name.
